

Data Structures

A **data structure** is a way of organizing and storing data in a program so that it can be accessed and used efficiently. It refers to a collection of data elements and the relationships among them, along with the functions or operations that can be applied to the data.

Data structures are another category of data types, just like *strings*, *ints*, *floats*, and *booleans*. There are many built-in types, such as arrays (called **lists** in Python) and maps (called **dictionaries** in Python).
